To whom it May concern:

Re: Offshore Platform Supply

As a result of successful testing with Royal Dutch Shell, Shell Offshore has chosen MCU Coatings to supply for platform maintenance for its OneGas field. This is located in the N Sea in the Dutch and UK sectors.

In this region the climate yields quite substantial amounts of moisture and temperature swings. Supply has started in 2015 and mainly by 2 contractors; Venko and Salamis have carried out the application. The contractors have been hugely satisfied with the application properties of the product and have saved a tremendous amount of time for both the surface preparation as well as the application, completing work in record time in comparison with the traditional epoxy systems.

Due to the success here interest has been sparked in many other areas around the globe from Shell as well as other oil and gas companies and platform operators. EIL India has specified MCU Coatings for maintenance of over 30 platforms off the coast of India.

Sincerely yours,

Morten Sorensen
